The on-site testing system for drugs of abuse in oral fluid
Cozart®
RapiScan
Oral fluid drugs of abuse testing system

Cozart® RapiScan was developed by Cozart and is the world’s first fully integrated, on-site, oral fluid based drugs of abuse diagnostic system.

Cozart® RapiScan is an innovative drugs of abuse testing system which provides reliable results in a matter of minutes. The system offers a number of benefits:

• The use of oral fluid enables simple, painless, non-invasive, sample collection.
• Sample adulteration is less likely as collection can be directly observed.
• It is easy and straightforward to use.
• It provides on-the-spot results in minutes rather than hours or days as required by conventional laboratory testing.
• It allows for simultaneous detection of up to five different drug groups from a single sample.

Removing the doubt from on-site diagnosis

The hand-held Cozart® RapiScan instrument minimizes user-error and removes all subjectivity from diagnosis. The system accurately times the incubation period, reads, interprets and stores the results which are displayed on the screen and can be printed. A secondary signal of green or red flashing lights gives immediate operator feedback. The system can be used in dim light or outside, where visual interpretation may be difficult.

Unlike many other biological samples, in which drug traces can persist for considerable periods, the concentration of drugs in oral fluid is a better indicator of drugs present in the blood.

Test cartridges include:

Five drug panels
• Cannabinoids, Amphetamine, Cocaine, Opiates, Benzodiazepines
• Methadone, Amphetamine, Cocaine, Opiates, Benzodiazepines

Two drug panels
• Methadone, Opiates
• Cocaine, Opiates

Single drug panels
• Methamphetamine/MDMA
• Buprenorphine (Urine)
